

-bedal-patch®

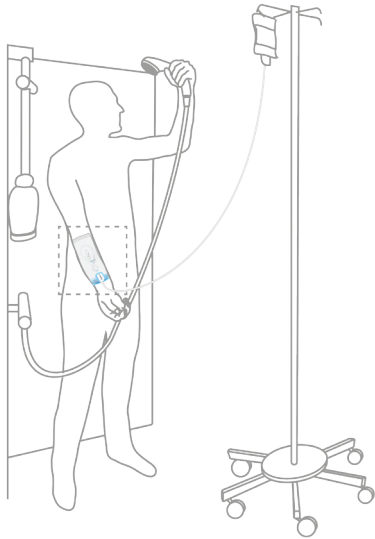

Enabling patients with IV therapy to wash autonomously

The BedalPatch enables patients to wash and shower safely, with minimal intervention from the nursing staff. It provides an adequate shielding of the exit site, and increases the patient autonomy.

- Usable with PICC, CVC and port-a-cath
- One size fits different exit sites
- All french sizes
- Arm or chest position of the exit site

Patients that receive intravenous therapy can wash autonomously with the BedalPatch

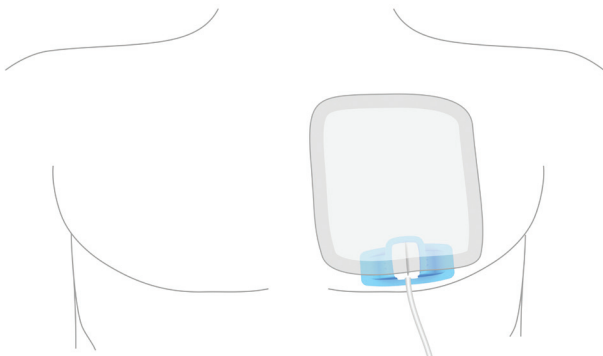

Intravenous therapy is amongst the most widespread treatments in the medical treatment. One of the common downsides of this therapy is the **effect on the patient comfort**: in order to wash or shower, an adequate shielding of the intravenous exit site is mandatory. Due to the lack of adequate solutions, most hospitals do not allow patients to wash while connected to an intravenous catheter. When showering is allowed, the time spending of hospital staff in assisting patients to shower represents significant costs.

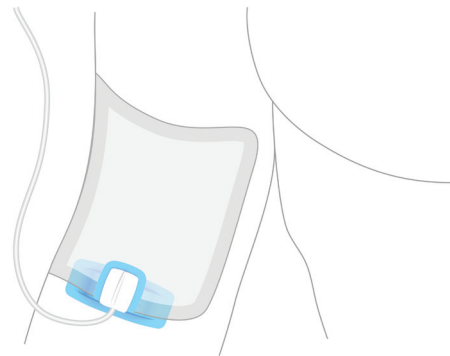

The BedalPatch is a **transparent patch to cover the IV exit site during washing or showering**. It allows a patient that receives intravenous therapy to wash autonomously or with minimal intervention.

The BedalPatch is **usable for different exit site locations**, such as the arm and chest.

CHEST POSITION

ARM POSITION

Increasing patient autonomy

Decreasing nursing time

Versatile: usable for PICC, CVC, Midline, PVC ...

Keep infusion line connected

No need for fixation dressing change
