

-bedal-patch®

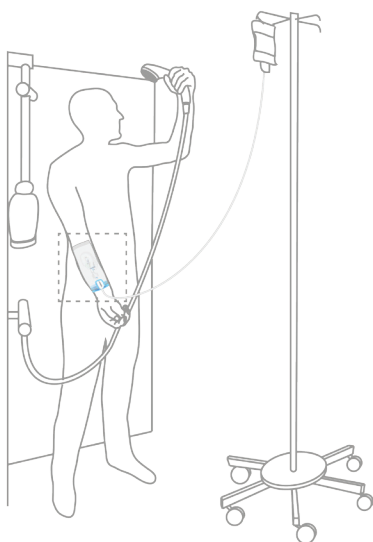

Enabling patients
with IV therapy
to shower safely

The BedalPatch enables patients to wash and shower safely with or without an I.V. line connected.

- Usable with PICC, CVC, Midline, PVC...
- One size fits different exit sites
- No need for dressing changes
- Covers Arm or Chest exit site positions

Patients that receive intravenous therapy can wash autonomously with the BedalPatch

Intravenous therapy is among the most widespread treatments in healthcare. One of the common downsides of this therapy is the effect on patient comfort and overall hygiene. In order to wash or shower, adequate water shielding of the intravenous exit site is mandatory.

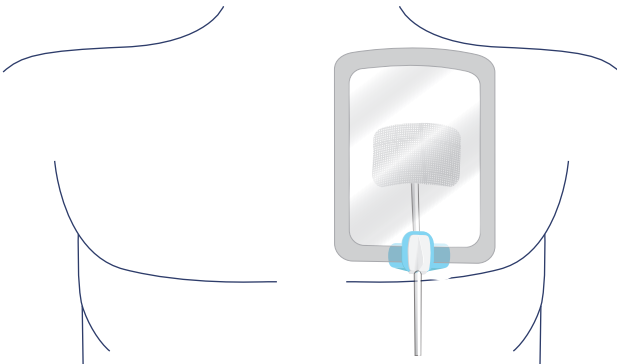

The lack of solutions designed to provide waterproofing of the intravenous exit site has caused most hospitals to not allow patients to shower while connected to an I.V. line.

Bedal offers a cost effective solution in the BedalPatch, a transparent, waterproof film that covers the catheter exit site along with an integrated locking component designed to provide a watertight seal around the IV Line.

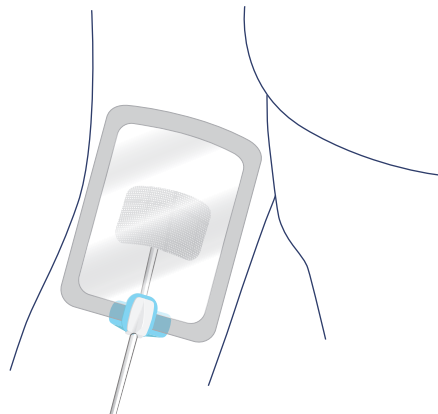

BedalPatch also allows intravenous patients to wash autonomously or with minimal intervention.

The BedalPatch is indicated for different exit site locations, such as the arm and chest.

CHEST POSITION

ARM POSITION

Keep infusion line connected

No need for fixation dressing change

Versatile: usable for PICC, CVC, Midline, PVC...

Decrease nursing time to prep patient to shower

Increase patient autonomy
